

## ASSIGNMENT A3

---

### 1. Objective

The objective of this assignment is to allow students to become familiar with the client-server architectural style.

### 2. Application Description

Use the C# API to design and implement a client-server application for managing the consultations of doctors in a clinic. The application has three types of users: the clinic secretary, the doctors and an administrator.

The clinic secretary can perform the following operations:

- Add/update patients (patient information: name, identity card number, personal numerical code, date of birth, address).
- CRUD on patients' consultations (e.g. scheduling a consultation, assigning a doctor to a patient based on the doctor's availability).

The doctors can perform the following operations:

- Add/view the details of a patient's (past) consultation.

The administrator can perform the following operations:

- CRUD on user accounts.

In addition, when a patient having a consultation has arrived at the clinic and checked in at the secretary desk, the application should inform the associated doctor by displaying a message.

### 3. Application Constraints

There will be 3 applications, one for every type of user and including only the functionality for that type of user. The architecture should be client-server and the data will be stored in a database. The client applications will be Windows Forms applications. Use a .Net Web API to expose the server functionality to the client applications. Create a pooling mechanism in a separate Thread which will query the server at predefined short intervals to find out if a new patient has checked in.

#### **4. Requirements**

- Create the analysis and design document (see the template).
- Implement and test the application.

#### **5. Deliverables**

- Analysis and design document.
- Implementation source files.

#### **6. References**
